

Quantitative methods

Week #2

Gergely Daróczy

Corvinus University of Budapest, Hungary

17 February 2012

Notes

Outline

- 1 Types of error
 - Measurements
 - Gone Hunting
- 2 Elements of Research Design
 - Possible goals of research
 - Units of analysis
 - Ecological fallacy
 - Ecological fallacy
 - Variables and attributes
 - Types of variables and attributes
 - Relation between variables
- 3 Levels of Measurement
 - Relationship between variables
- 4 Stages of Social Research

Notes

Measurements

Types of error

Measuring the temperature of a bowl of water kept at 60°C

Notes

Gone Hunting

Types of error

Source: customerthink.com

Notes

Social research

Types of error

We measured the height of 10 students:

Notes

Social research

Types of error

We measured the height of 10 students:

Notes

Possible goals of research

Brainstorming

Which of the followings would make a good topic for research?

- How many homeless people lives in Budapest?
- What is the most popular way of suicide?
- What color is a banana?

Possible goals of research

Brainstorming

Which of the followings would make a good topic for research?

- How many homeless people lives in Budapest?
- What is the most popular way of suicide?
- What color is a banana?
- How much does a pile of apples cost?
- What kind of relationship can be found between bodyweight and hair-color?
- Which is the best book in the world?

What could be the main factors of choosing a topic?

Definition: exploratory vs. descriptive vs. explanatory study

Notes

Units of analysis

Units, cases, objects

What entities are described and compared below?

- Are older people more afraid of crime than younger people?
- Does economic development lower the birth rate?
- Which Hungarian soccer team has the utmost fan club?
- The longer the emgagement period, the longer the marriage.
- What is the most prestigious occupation?

Do we always ask the units of analysis?

Notes

Units of analysis

Ecological fallacy and so

We found, that 2 million tourists arrived to Budapest in 2010. It was also known, that 2.5 million tourists visited the lake Balaton in the same year.

Could we state that ...

- the inhabitants of Budapest are not as friendly as people living at the lake Balaton?
- Budapest has less spectacle than the lake Balaton?
- the lake is a bigger tourist goal?
- tourists think that lake Balaton is a lot nicer place than Budapest?
- the beach of Balaton is lot more crowded than the streets of Budapest?

What can be said based on the above data?

Notes

Ecological fallacy

A classical example

Emile Durkheim (1897): *Le Suicide*

- Suicide rates are higher in men than women.
- Suicide rates are higher for those who are single than those who are married.
- Suicide rates are higher for people without children than people with children.
- Suicide rates are higher among Protestants than Catholics and Jews.
- Suicide rates are higher among soldiers than civilians.

Definition

The ecological fallacy occurs when you make conclusions about individuals based only on analyses of group data.

Gergely Daróczy (BCE) Quantitative methods, 2/14 17/2/2012 11 / 22

Notes

Variables and attributes

A concrete example

How old are you?

- >18
- 19-24
- 25-30
- 31-40
- 41-100
- 100<

What is variable and what is attribute in the above example?

Gergely Daróczy (BCE) Quantitative methods, 2/14 17/2/2012 12 / 22

Notes

Variables and attributes

Test your knowledge!

Research topics:

- Are older people more afraid of crime than younger people?
- Does economic development lower the birth rate?
- Which Hungarian soccer team has the utmost fan club?
- The longer the engagement period, the longer the marriage.
- What is the most prestigious occupation?

What is variable and what is attribute in the above example?

Gergely Daróczy (BCE) Quantitative methods, 2/14 17/2/2012 13 / 22

Notes

Types of variables and attributes

Towards methodology

Types of variables

- explanatory variables
 - dependent variables
 - qualitative variables
 - quantitative variables
 - independent variables
 - qualitative variables
 - quantitative variables
- extraneous variables
 - control variables
 - other variables

Let's make up some examples based on the above list!

Notes

Relation between variables

A visual example

```
ggplot(diamonds, aes(cut, price)) + geom_boxplot() + xlab('') + ylab('') +  
scale_y_continuous(formatter="dollar") + theme_bw() + opts(title="53.940 diamonds")
```

Notes

Relation between variables

A visual example

```
ggplot(diamonds, aes(carat, price)) + geom_point() + geom_smooth() + ylab('') +  
scale_y_continuous(formatter="dollar") + theme_bw() + opts(title="53.940 diamonds")
```

Notes

Relation between variables

A visual example

```
ggplot(diamonds, aes(clarity, fill=cut)) + geom_bar() + ylab("N") +
  theme_bw() + opts(title="53,940 diamonds")
```

Gergely Daróczy (BCE)

Notes

Relation between variables

A visual example

```
ggplot(diamonds, aes(clarity)) + geom_bar() + ylab("N") + facet_wrap(~ cut) +
  theme_bw() + opts(title="53,940 diamonds")
```

Notes

Levels of Measurement

Qualitative and quantitative variables in depth

Qualitative variables:

- Nominal: exhaustive labels with no intersect (mutual exclusivity) not in a specific order
- Ordinal: an (possible) ordered variable with exhaustive labels not intersecting

	Nominal	Ordinal	Interval	Ratio
Classification	X	X	X	X
Rank order		X	X	X
Equal intervals			X	X
Nonarbitrary zero				X

Quantitative variables:

- Interval: equal distances between the ordered labels (numbers)
- Ratio: a scale with a zero point

Notes

Types of variables and attributes in practice

Relationship between variables

Possible relationship between variables:

- association,
- correlation,
- spurious relationship,
- influence,
- direction of influence,
- **causality.**

What is hypothesis?
